

## Abstract

A multifunctional receptacle with load-leveling capabilities includes a base member having a bottom side and side member extending upward from said bottom side, a storage member pivotally connected to the side member to enable the storage member to have at least a limited range of movement with respect to the base member and to permit a range of inclined positions respectively between the base member and the storage member; and a removable connector interconnecting the base member and the storage member for maintaining the storage member in a selectable fixed incline position with respect to the base.
